

Geographic distribution

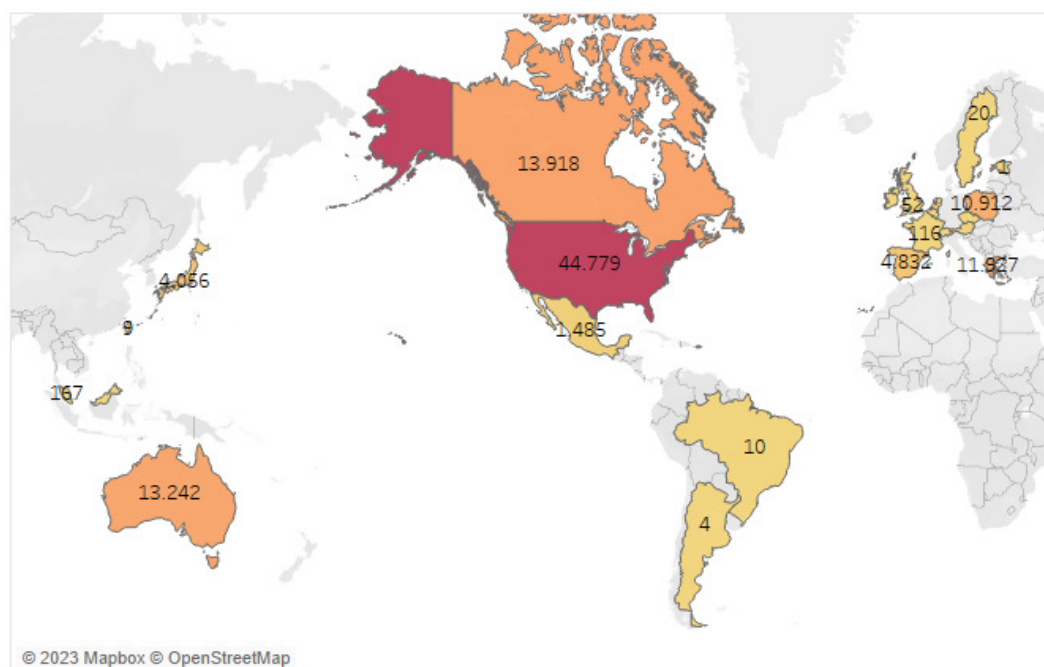

visitors per study

Almost 3/4 of all visitors are interested in the adults campaign.
Most visitors (41%) are located in the US. For the children's campaign Poland is significant more important.

To increase the amount of interested people it's worth to have a look at the differences from Poland's advertising / SEO compared to the rest of Europe.

geographic distribution of visitors

	Visitor	% total
United States	44.779	41,24%
Canada	13.918	12,82%
Australia	13.242	12,19%
Greece	11.927	10,98%
Poland	10.912	10,05%
Spain	4.832	4,45%
Japan	4.056	3,74%
Netherlands	2.465	2,27%
Mexico	1.485	1,37%
Austria	491	0,45%
Malaysia	167	0,15%
France	116	0,11%
Switzerland	91	0,08%
Belgium	55	0,05%
United Kingdom	52	0,05%
Sweden	20	0,02%
Ireland	18	0,02%
Brazil	10	0,01%
Czech Republic	10	0,01%
Taiwan, Province of China	9	0,01%
Argentina	4	0,00%
Estonia	1	0,00%

visitors - unique patient IDs

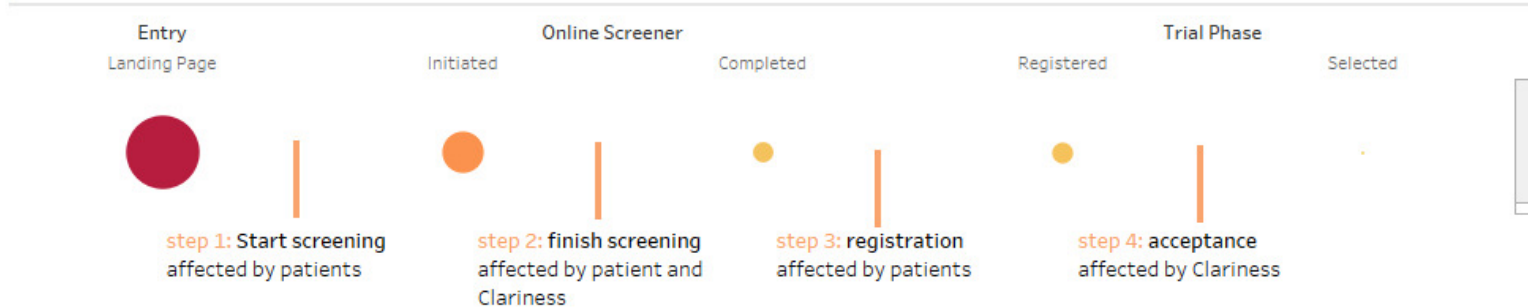

Success rate and Patients Journey

As the goal is to reach a specific number of patients for taking part in a study, the main KPI for success of a campaign is the amount of people who are selected for the trial. I call this KPI success rate.

Nevertheless it's a journey to get from an entry (visit landing page) to be selected for the trial. Based on the given data the patients journey consists of 3 phases: Entry, Online Screening, Trial Phase. While starting the Screening is an active decision of the patient and therefore can be increased by an higher motivation of the page visiting patient, the trial phase is based on the results of the screening. ...

During the process of registration there are 4 critical steps to consider. Each step is influenced by different aspects. In this study the most critical step is the completion of the Online Screening. Also the rate from successful online screening to selected for trial has some room for improvement.

The data also shows some journeys starting at a later point.

** trial is considered a phase you can only reach after successful online screening. Again there are some anomalies in the data set.

If these phenomena are not due to the cut for the data set, it should be analysed if there is a technical issue.

Metrics:

visitors - unique patient IDs

success rate - % of visitors selected for trial / visitors landing page

Details - patient influenced

Step 1

% of visitors reach this stage
visitor

Landing Page

Initiated

100,00%
102.162

31,94%
32.628

Only 32% of the visitors startet the screening.

possible reasons:

- study didn't match expectation of patients
- patients didn't find start for screening
- requirements for screening not what patients expected

deep dives / follow ups:

- check advertisement and landing page / compare different advertisments
- analyze page duration for landing page (longer page duration => more intense reading of content => more likely that requirements are determend factor)
- A/B test for placement start button screening

Step 2

% of visitors reach this stage
visitor

Initiated

Completed

100,00%
32.628

23,90%
7.797

76% of the patients who started the screening didn't finish it successfully.

possible reasons:

- screening questionnaire too long
- screening questionnaire not appealing
- patients didn't feed the requirements

deep dives / follow ups:

- analyze clicks / bounces different pages of screening questionnaire
- anaylze how often questionnaire ended because of non- matching requirements => issues in description of study design / missing information about what kind of patients is looked for at landing page?

Step 3

% of visitors reach this stage
visitor

Completed

Registered

100,00%
7.797

107,39%
8.373

More patients registered than succesfully finished the screening.

Everyone finishing the screening is also willing to register.

deep dive / follow ups:

- check funnel: how can you register without screening? => fix it

Details – questionnaire influenced

Step 4

% of visitors reach this stage
visitor

Registered

Selected

100,00%
8.373

0,57%
48

For the whole study only 4 people were selected to take part.

possible reasons:

- long duration for validation, selection ongoing
- screening didn't match all criterias

deep dives / follow ups:

- check durations
- analyse reasons for not selecting => adjust screening questionnaire

Process duration

days after last page

Online Screener

Initiated

Completed

2,0

1,0

Trial Phase

Registered

Selected

2,1

26,5

Time frame between registration and selection takes more than 10 times than all the other steps.

Process duration is determined by the time of this step. This finding appears in all countries and study variations.

per study variation

Study name	Online Screener		Trial Phase	
	Initiated	Completed	Registered	Selected
Adults	2,0	1,0	2,1	26,7
Children	2,0	1,0	2,1	25,7

per country

Name	Online Screener		Trial Phase	
	Initiated	Completed	Registered	Selected
